

ANSER | NETCOM LEARNING | DAY 1, MODULE 2

From Champion to Multiplier

A working session on bringing Copilot in GCC High to the rest of the organization

This session	
Who this is for	The ANSER IT team: Copilot champions, early adopters, and the people colleagues ask first
Length	30 minutes
Format	Solo reflection, whole-group discussion, groups of three, report out, personal commitment
You leave with	A 10-minute teach-back you can run next week, answers to the five things colleagues will say, a first draft of something to take back, and one commitment
Bring	What you just saw in the Module 2 demo, and one real task from your own week

Part	What happens	Minutes
	Opening: why this session, and why you	1
1	On your own: what would you show a colleague?	3
2	Whole group: the five colleagues you are going to meet	8
3	Groups of three: build one thing to take back	10
4	Report out: two minutes per group	6
5	On your own: one commitment	2
	Total	30

Why this session, and why you

You have just watched one status email go from a template to something a client could act on. Nothing about Copilot changed between the first version and the last. What changed was how it was asked, and that part can be taught.

Most of your colleagues will not take a two-day course. They will learn Copilot from whoever sits near them and seems to get good results. For a lot of people at ANSER, that is going to be you. This session is where you decide what you will show them, what you will say when they push back, and what the organization should agree on so that everyone is working the same way.

There is also something only this group can do. Almost everything written about Copilot online describes the commercial cloud. Your colleagues will read it, expect it, and be confused when their screen looks different. You are the people who know what is true in a GCC High tenant today.

Six ideas from Module 2 worth passing on

Idea	The short version	What you saw
1. Start with a clear goal	Microsoft's guidance is that a clear goal is the only required part of a prompt. Context, Source, and Expectations are what make it good.	Version 1 to Version 2
2. Name your sources	If you do not say which files to use, Copilot chooses for you. Type / or use the plus menu and point at the right ones.	The jump at Version 4
3. New chat to compare, same chat to refine	Start fresh when you change the task. Stay in the conversation when you are improving a draft.	Five versions, then five follow-ups
4. Review out loud	Check the numbers, check for anything that should not leave the building, check the dates. Every time.	The three checks on Version 5
5. Copilot repeats your documents	If your notes contain a mistake, Copilot can repeat it with confidence. Ask where your sources disagree.	The January 15 date
6. Web search is a choice	Public question, web on. Sensitive file, web off. The control is the toggle, not a sentence in the prompt.	The search queries in the citations

Part 1. On your own: what would you show? (3 minutes)

Write quickly. Nobody collects this. You will use your answers in Part 3.

The one moment from the demo I would show a colleague first And why that one.	
A task from my own week where a one-line prompt would have failed Describe the kind of task only. Leave out names, clients, and anything sensitive.	
The first person or team I would show What do they spend their day doing?	
The question I expect them to ask me	

Part 2. Whole group: the five colleagues you are going to meet (8 minutes)

Each of these is something a real colleague will say to you in the next month. Pick the one you are least sure how to answer. As the group talks, fill in what you would say and, more important, what you would show. A thirty-second demonstration usually beats a three-minute explanation.

Colleague 1: The one who tried it once

"I asked it for a status email and got a template with square brackets. I can write a template myself."

What is behind it: They typed a goal and nothing else, got Version 1, and decided that is all Copilot does.

What I would say

What I would show

Colleague 2: The one who is worried

"We handle controlled information. I am not typing anything into an AI."

What is behind it: They are picturing a public chatbot. They do not know what is different about Copilot inside a GCC High tenant, or what your organization's rules are.

What I would say

What I would show

Colleague 3: The one who compares

"My friend at a commercial company has Copilot writing their meeting notes in Teams. Why does ours not do that?"

What is behind it: They have seen commercial features and assume something is broken or was not switched on.

What I would say

What I would show

Colleague 4: The one who trusts too much

"Copilot wrote it, the numbers looked right, so I sent it."

What is behind it: The output looked finished, so they treated it as finished.

What I would say

What I would show

Colleague 5: The one who is too busy

"I do not have time to learn prompt engineering. I have actual work to do."

What is behind it: They think the cost of learning is high and the payoff is vague.

What I would say

What I would show

Part 3. Groups of three: build one thing to take back (10 minutes)

Your group takes one challenge. You have ten minutes, so aim for a rough first draft you would actually use, not a finished product. Choose one person to report out in Part 4. You get two minutes.

Two ground rules for anything you build

Keep it true for GCC High. If you are not sure a feature exists in your tenant today, leave it out or mark it to check. The reference pages at the back of this workbook list what was available when this course was prepared.

Keep sensitive content out of your examples. A good teaching example uses an ordinary task and ordinary files.

Challenge A. The 10-minute teach-back

Design a short version of today's demo that you could run in someone else's team meeting. Use a task that team really does. The goal is one moment where they see a weak prompt and a strong prompt side by side.

The team and the task Who is in the room, and what everyday task will you use?	
The one-line prompt What would they type today?	
Goal What do you want, about what, covering what?	
Context Who is it for and why do they need it?	
Source Which files, and how will you reference them?	
Expectations Length, format, tone, what to leave out	
One follow-up prompt The single iteration move you would show	
The review What will you check out loud before you trust it?	

Your last sentence What do you ask them to try this week?	
--	--

Challenge B. The shared prompt shelf

A prompt that works is worth sharing. Decide what ANSER's first shared prompts should be, where they should live, and who keeps them healthy.

The first five prompts on the shelf

#	The task it handles	Who would use it	Which app
1			
2			
3			
4			
5			

Where the shelf lives

Options that are listed as available in GCC High today. Circle one, or name your own.

Option	Good for	Watch out for
Copilot Prompt Gallery	Saving a prompt you have run and sharing it by link, right where people use Copilot	Sharing a prompt to a Teams team should be confirmed in your tenant before you promise it
A Copilot Page or Notebook	A living collection the champions edit together, with examples and notes	People need to know it exists and where to find it
A SharePoint page or list	A single official location with owners, dates, and categories	Someone has to keep it current

Our choice, and why	
What a prompt needs before it goes on the shelf For example: written as GCSE, tested in our tenant, no sensitive content in the prompt text, an owner, a date	
Who looks after the shelf, and how often	

How colleagues will find out it exists	
--	--

Challenge C. The house rules

Draft a one-page “How we use Copilot here.” Five to seven rules, each short enough to remember and each with a reason. You are drafting a proposal for the people who own policy at ANSER, not setting policy in this room.

Starting points: reviewing before sending, naming sources, sensitive content and web search, what to do when a feature is missing, where to ask for help.

#	The rule, in one sentence	Why it matters	Who would need to agree
1			
2			
3			
4			
5			
6			
7			

Part 4. Report out (6 minutes)

Two minutes per group. While the other groups talk, write down what you would borrow.

Group	Their best idea	What I would borrow for my own teams
A. The teach-back		
B. The prompt shelf		
C. The house rules		

Part 5. On your own: one commitment (2 minutes)

Keep it small enough that you will do it. You will be asked about it tomorrow morning.

In the next 7 days I will One thing, with one person or one team	
In the next 30 days I will	
The person who will ask me whether I did it	
How I will know it worked Copilot Analytics in Viva Insights is not currently available in GCC High, so pick something you can see for yourself: colleagues shown, prompts added to the shelf, a question that stops reaching the help desk.
